IncidentIQ: AI-Powered Root Cause Analysis Generator

Prompt 1 — Project Foundation

- Create a complete enterprise-grade web application called IncidentIQ – AI Powered Incident Intelligence & Root Cause Analysis Platform.
- The platform should help software teams analyze incidents using timelines, logs, and code changes, then generate AI-powered RCA reports.
- Use React for the frontend, Node.js and Express for the backend, SQLite as the database, JWT authentication, and a modern SaaS UI design.
- The application should feel like a premium product rather than a student project.

Prompt 2 — Authentication System

- Build a secure authentication system with registration, login, logout, forgot password, and JWT session management.
- After login, users should not be redirected directly into a dashboard.
- Instead, they should first see a role selection screen where they can choose either Developer or IT Manager.
- The role selection should appear every time the user logs in.
- The UI should match a modern SaaS product with attractive cards and smooth animations.

Prompt 3 — Role-Based Workspace

- Create a role selection page that asks the user how they want to use IncidentIQ for the current session.

- Provide two large interactive cards:
    - Developer
    - IT Manager

- The Developer card should mention RCA generation and incident investigation.

- The IT Manager card should mention RCA review, approvals, and operational oversight.

- The design should feel similar to premium onboarding experiences found in Stripe, Linear, or Vercel

Prompt 4 — Developer Dashboard

- Create a clean developer workspace without sidebars or cluttered dashboards.

- Show only two primary actions:
    - Analyse Incident
    - RCA History Reports

- Both should be displayed as premium interactive cards in the center of the screen.

- Hovering over the cards should trigger subtle glow effects, animations, and border highlights.

- The goal is to make users immediately understand the main workflow.

Prompt 5 — Incident Analysis Workflow

- Create a guided incident investigation workflow using a horizontal stepper.

- The steps should be:
  - Timeline
  - Error Logs
  - Git Diff
  - Generate RCA
  - Timeline and Error Logs should be mandatory.
  - Git Diff should be optional.

- The workflow should feel like a setup wizard rather than a form.

- Users should be guided step by step until RCA generation becomes available.

Prompt 6 — Multi-Agent AI Architecture

- Implement a multi-agent RCA pipeline.

- The system should contain:
  - Input Processing Agent
  - Timeline Analysis Agent
  - Log Analysis Agent
  - Git Diff Analysis Agent
  - Root Cause Analysis Agent
  - Report Generation Agent

- Each agent should analyze its specific data source and contribute findings to a final RCA report generated using Gemini or Groq.

Prompt 7 — RCA Report Generation

- Generate a structured RCA report after analysis.

- The report should contain:
    - Incident Summary
    - Timeline Analysis
    - Error Analysis
    - Git Diff Analysis
    - Root Cause
    - Impact Assessment
    - Severity
    - Confidence Score
    - Recommended Fixes
    - Prevention Actions

- Present the report using professional layouts, badges, timelines, metrics, and visual cards instead of plain text.

Prompt 8 — PDF Export System

- Create a professional PDF export feature.

- The generated PDF should resemble enterprise RCA documentation used in large software organizations include:
    - Executive Summary
    - Incident Timeline
    - Evidence Analysis
    - Root Cause
    - Recommended Fixes
    - Prevention Plan
    - Report Metadata
    - Confidence Score
    - Page Numbers
    -

- The PDF should feel like a real corporate incident report.

Prompt 9 — Manager Review Workflow

- Implement a complete approval workflow.

- When a developer submits a report, collect:
  - Developer Name
  - Email Address
  - Team Name

- Store the report in SQLite and automatically display it in the IT Manager dashboard.

- Managers should be able to review, approve, reject, and comment on reports.

- All actions must be permanently stored.

Prompt 10 — AI Copilot

- Create a floating AI Copilot available on every page.

- The assistant should understand the current page context.

- For example:
  - On Analyse Incident page, explain timelines, logs, and Git Diff.
  - On RCA Report page, explain severity, confidence score, and root cause.
  - On Manager Dashboard, explain approval workflows and report status.
  - The chatbot should have a modern floating design similar to Intercom or Notion AI.

Prompt 11 — RCA History & Report Management

- Create an RCA History section where every generated report is automatically stored.

- Allow users to:
  - View Reports
  - Download PDFs
  - Submit Reports to Managers
  - Delete Reports
  - Search Reports
  - Filter Reports by Status
  - Statuses should include:
  - Generated
  - Submitted
  - Approved
  - Rejected

- All data should persist in SQLite.

Prompt 12 — Premium SaaS UI Redesign

- Redesign the entire application to feel like a modern enterprise SaaS platform.

- Use a clean grid background, soft gradients, glassmorphism effects, premium typography, smooth animations, floating cards, and modern spacing.

- The visual quality should be comparable to Linear, Stripe, Vercel, and Notion.

- Every page should feel polished, responsive, and investor-demo ready.

- The final product should look like a commercial AI platform rather than an academic project.
